

LiveData's Real-Time Integration Server acquires data -- in real-time--from virtually any source, correlates it and automates rule-based presentation to applications within the utility. LiveData has extensive experience with real-time physical data streams from applications such as SCADA, EMS, and OMS, relational databases and the latest Web technology.

From legacy systems to the newest business information systems, the LiveData RTI Server is a powerful solution to make complex real-time data management "point and click" simple.

Real-Time. The LiveData RTI Server is designed to be used as a stand-alone system providing real-time asset management or as an efficient, non-intrusive way to integrate real-time physical data information (SCADA & ICCP) directly into an already existing enterprise-wide information system, without requiring custom interface programming.

No Custom Interfaces. Quick and easy to install, with minimal cost, the LiveData RTI Server allows utilities to deploy new applications in record time. With the LiveData RTI Server, you eliminate the need for costly custom interfaces and you create a cost-effective way to manage current and future upgrades.

Data Analysis. Configured through the powerful web-based LiveData administrative GUI, the RTI Server easily and seamlessly connects to almost any existing automation or information system, making the data instantly available for analysis, storage, reporting, and monitoring. With one-button creation of bi-directional links to MS Excel, extensive data analysis features are instantly available on user-familiar spreadsheets.

LiveData is based in Cambridge, Massachusetts, and supplies product-centric solutions to Fortune 500 utilities, mid-size utilities, major power providers worldwide, and state and national governments. Our solutions are in use in energy management, distribution management, generation control, substation automation, energy trading floors and outage management.

For more information, call 617.576.6900 (in the USA or Canada, call 1.800.570.6211), e-mail info@livedata.com, or visit us at www.livedata.com.

RTI Server 5.0

Custom Screens. Individualized custom data screens are easily set up to be viewed on any authorized desktop, using either an internet browser or the Windows GUI. LiveData's own analytical toolset, including VML and SVG tools for browser-side graphics, includes GIS mapping and the ability to execute the analytic "wires model," with the graphical workload portioned onto the desktop. This approach allows true scalability without the back-end grinding to a halt.
